

ABSTRACT

~~Disclosed is a~~ A method for supervising ~~[[the]]~~ a network connection employing an electronic apparatus employing in turn an OS (operating system) of a non-event driven system. The electronic apparatus includes a connector jack (11) for a local area network (LAN), an access controller (12) for detecting that a LAN cable (22) has been connected to or disconnected from ~~this~~ the connector jack, and a micro-computer (13). A detection output of the access controller is supplied as an interrupt signal to the micro-computer. ~~When an interrupt by the detection output of the access controller has occurred~~ Upon detection of the interrupt signal, the micro-computer carries out the processing for connection/disconnection of the LAN cable.
